Professional Summary

Senior full stack Software Engineer with 12+ years shipping production products **end-to-end**: mobile apps (Flutter — 8+ years, React Native/Expo, and native Swift/SwiftUI and Kotlin/Java), backend services and APIs (Spring Boot, Dart/Serverpod, Firebase Cloud Functions), and web frontends/admin panels — through **CI/CD to App Store, Google Play and web**.

Deep **mobile architecture** experience: shared business logic, modular design, custom native plugins/SDKs via Platform Channels, and performance-oriented refactors of large production codebases — including a flagship consumer app with **500,000+ downloads**. Strong backend foundation: **PostgreSQL** (schema design, indexing, optimization), REST/RPC API design, event-driven payment integrations, authentication/authorization and idempotent transaction systems.

AI-native engineer: daily use of **Claude Code, Cursor and GitHub Copilot** for code generation, tests, documentation, refactoring and debugging — with critical review for quality and security. Led mobile teams of **up to 10 engineers**; comfortable owning features from design to production across the full stack.

Core Skills

- **Mobile**: Flutter/Dart (8+ yrs production), React Native / Expo (React, TypeScript), Swift / SwiftUI / UIKit, Kotlin / Java, Android Architecture Components, Platform Channels, custom native plugins & SDK modules, mobile security & attestation (SafetyNet, Play Integrity, App Attest)
- **Backend**: Java (7+) / Kotlin with Spring Boot, Dart/Serverpod, Firebase Cloud Functions, REST/RPC API design (versioning, serialization, pagination), microservice patterns, event-driven/webhook architectures, PostgreSQL (schema design, indexing, query optimization), Firebase/Firestore
- **Web**: React, TypeScript, modern JavaScript/HTML/CSS, admin panels & internal dashboards, REST/GraphQL API consumption
- **Cloud & delivery**: Docker, CI/CD pipelines (build/test/release), Play Store & App Store release management, web deployment, monitoring & observability (Firebase Crashlytics/Analytics, logging, alerting)
- **Payments & security**: Paystack, Flutterwave, Interac, wallet/payout/escrow flows, idempotency, token/attestation verification, RBAC, fraud & abuse prevention
- **Practices & leadership**: feature ownership design-to-production, 2-week sprints, code review, mentoring (teams up to 10), system design & architecture reviews, technical-debt pragmatism

Professional Experience

Engineering Lead / Senior Software Engineer — Eyewa

Consumer platform · flagship app 500,000+ downloads · mobile + backend

- Owned features **end-to-end**: mobile app (Flutter with native Swift/Kotlin integrations), backend workflows, APIs and release pipelines.
- Led mobile team of **up to 10 developers** — mentoring, code review, architecture standards, sprint delivery.
- **Shared business logic & modularity**: repository/use-case layers reused across platforms; custom plugins and SDK modules bridging Kotlin/Java and Swift via Platform Channels.
- **Backend & APIs**: shaped REST services, auth flows and payment/fulfilment workflows; enforced validation and security decisions server-side.
- **Production quality**: large-scale refactor of inherited codebase for performance, modularity and maintainability; Crashlytics-driven triage and profiling.

Senior Software Engineer — DeyChop

Full stack marketplace · 4 role-based apps + backend services

- Delivered **4 production applications** (Customer, Vendor, Rider, Admin) on shared Flutter/Dart + Firebase/backend architecture.
- **Platform migration:** DeyChop was originally built in React Native (Expo); led the port to Flutter across the customer app and **Backoffice web** — preserving feature parity and data continuity.
- **Backend-controlled transactions:** idempotent wallet/payout processing, funding, withdrawals, escrow-style delivery payments, confirmation-code release.
- **Security & authorization:** RBAC, session verification, confirmation-code workflows, payment authorization — enforced server-side across all apps.

Senior Software Engineer — Faadaaka

Fintech / wallet product · mobile + backend

- Transaction PIN flows, wallet controls, **Paystack** integration, reCAPTCHA-protected sensitive operations — security-sensitive decisions backend-enforced.

Senior Software Engineer — Wiremoney / Wyr

Cross-border remittance · mobile + backend

- Encrypted transaction flows, secure token storage, payment-provider integrations, backend-controlled transaction state and compliance-aware data handling.
- **Event-driven payments:** webhook-driven status updates reconciled into consistent transaction state.

Cross-platform & Web Development

React Native / Expo and web projects

- Built cross-platform features with **React Native / Expo** (React, TypeScript) — native module integration, OTA update workflows — including the original DeyChop implementation before leading its Expo to Flutter migration.
- Developed **web frontends and admin dashboards** (React, TypeScript) consuming REST APIs for operations, content and user management.

Key Achievements

- **Scale:** flagship consumer app — **500,000+ downloads** (App Store + Google Play) with CI/CD release automation.
- **Full stack delivery:** mobile, backend and web surfaces for fintech-grade products (wallets, payouts, remittance) integrated with 3+ payment processors.
- **Leadership:** grew and led teams up to 10 — mentoring, review standards, architecture ownership.
- **AI-accelerated engineering:** embedded Claude Code / Cursor / Copilot into daily workflow while raising quality bars.

Positioning: one engineer across the whole product surface — mobile-first, backend-solid, web-capable — with production scale, fintech depth and an AI-native workflow.
